INSIGHTS

Render-blocking requests — Est savings of 2,390 ms

Requests are blocking the page's initial render, which may delay LCP. Deferring or inlining can move these network requests out of the critical path. LCP FCP Unscored

URL	Transfer Size	Duration
Google Fonts Cdn	1.6 KiB	780 ms
/css2?family=... (fonts.googleapis.com)	1.6 KiB	780 ms

Forced reflow

A forced reflow occurs when JavaScript queries geometric properties (such as offsetWidth) after styles have been invalidated by a change to the DOM state. This can result in poor performance. Learn more about forced reflows and possible mitigations. Unscored

Source	Total reflow time
[unattributed]	40 ms

Network dependency tree

Avoid chaining critical requests by reducing the length of chains, reducing the download size of resources, or deferring the download of unnecessary resources to improve page load. LCP Unscored

Preconnected origins

preconnect hints help the browser establish a connection earlier in the page load, saving time when the first request for that origin is made. The following are the origins that the page preconnected to.

Origin	Source
https://fonts.googleapis.com/	head > link `<link rel="preconnect" href="https://fonts.googleapis.com">`
https://fonts.gstatic.com/	head > link `<link rel="preconnect" href="https://fonts.gstatic.com" crossorigin="">`

Preconnect candidates

Add preconnect hints to your most important origins, but try to use no more than 4.

No additional origins are good candidates for preconnecting
